CE218472 - PSoC 6 MCU: Comparing External Voltages Using a Low-Power Comparator

Objective

This example demonstrates the voltage comparison functionality using the LPComp resource in PSoC® 6 MCU, with ModusToolbox™ IDE.

Requirements

Tool: ModusToolbox IDE 1.0

Programming Language: C

Associated Parts: All PSoC 6 MCU parts

Related Hardware: PSoC 6 BLE Pioneer Kit, PSoC 6 WiFi-BT Pioneer Kit, PSoC 6 WiFi-Prototyping Kit

Overview

This code example demonstrates how to configure the low-power comparator (LPComp) resource for comparing internal reference voltage and external voltage input from a GPIO. The LED is used to indicate the comparison result.

Hardware Setup

This example uses the PSoC 6 BLE Pioneer Kit's default configuration. See the kit guide to ensure the kit is configured correctly.

Note: The PSoC 6 BLE Pioneer kit and the PSoC 6 WiFi-BT Pioneer kit ship with KitProg2. ModusToolbox only works with KitProg3. Before using this code example, make sure that the kit is upgraded to KitProg3. See ModusToolbox Help > ModusToolbox IDE Documentation > User Guide; section PSoC 6 MCU KitProg Firmware Loader. If you do not upgrade, you will see an error like "unable to find CMSIS-DAP device" or "KitProg firmware is out of date".

Software Setup

None.

Operation

Follow the instructions that came with your kit to make sure the kit is connected to your PC.

1. Place a potentiometer on P5[6] to change the Vplus input voltage.
2. Import the code example into a new workspace. If you are not familiar with this process, see KBA225201.
3. Program the PSoC 6 MCU device. In the project explorer, select the **mainapp** project. In the Quick Panel, scroll to the **Launches** section and click the **Program (KitProg3)** configuration.
4. Turn the knob of the potentiometer until the Vplus input is higher than Vref.
5. Confirm that KIT_LED2 is OFF.
6. Turn the knob of the potentiometer until the Vplus input is lower than Vref.
7. Confirm that KIT_LED2 is ON.

Debugging

You can debug the example to step through the code. Use the **Debug (KitProg3)** configuration. If you are unfamiliar with how to start a debug session with ModusToolbox IDE, see KBA224621.

Design and Implementation

PSoC 6 MCU is a dual-CPU architecture MCU with Arm® CM0+ and Arm CM4 CPUs. The CM0+ CPU enables the CM4 CPU on device reset. This code example uses one LPComp resource, one status LED, one GPIO used for the input external input voltage, and one potentiometer.

The main function compares the LPComp inputs when an interrupt triggers; it updates the LED state and goes into Deep Sleep to wait for the next interrupt. The status LED shows the voltage comparison result. If the positive terminal input is higher than the negative terminal input, the LED is OFF; otherwise, it is ON.

Note: The internal reference voltage (Vref) can vary; see the device datasheet for the range.

Resources and Settings

Table 1 lists the ModusToolbox resources used in this example, and how they are used in the design. For pin usage and configuration, open the **Pins** tab of the *design.modus* file.

Table 1. ModusToolbox Resources

Resource	Alias	Purpose
Low-Power Comparator	LPComp	Provide low-power voltage comparison
Digital Output Pin	KIT_LED2	Provide visual feedback
Analog Input Pin	Vplus	Provide user input

Figure 1 to Figure 3 show the non-default configuration settings for the ModusToolbox resources.

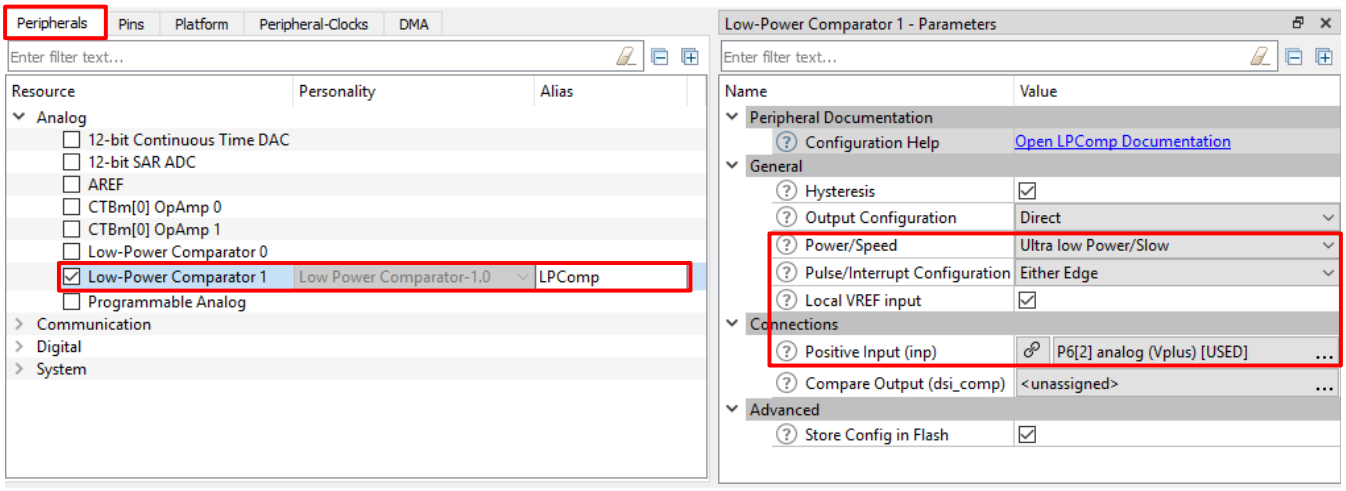

Figure 2. GPIO Configuration for Non-Inverting Terminal

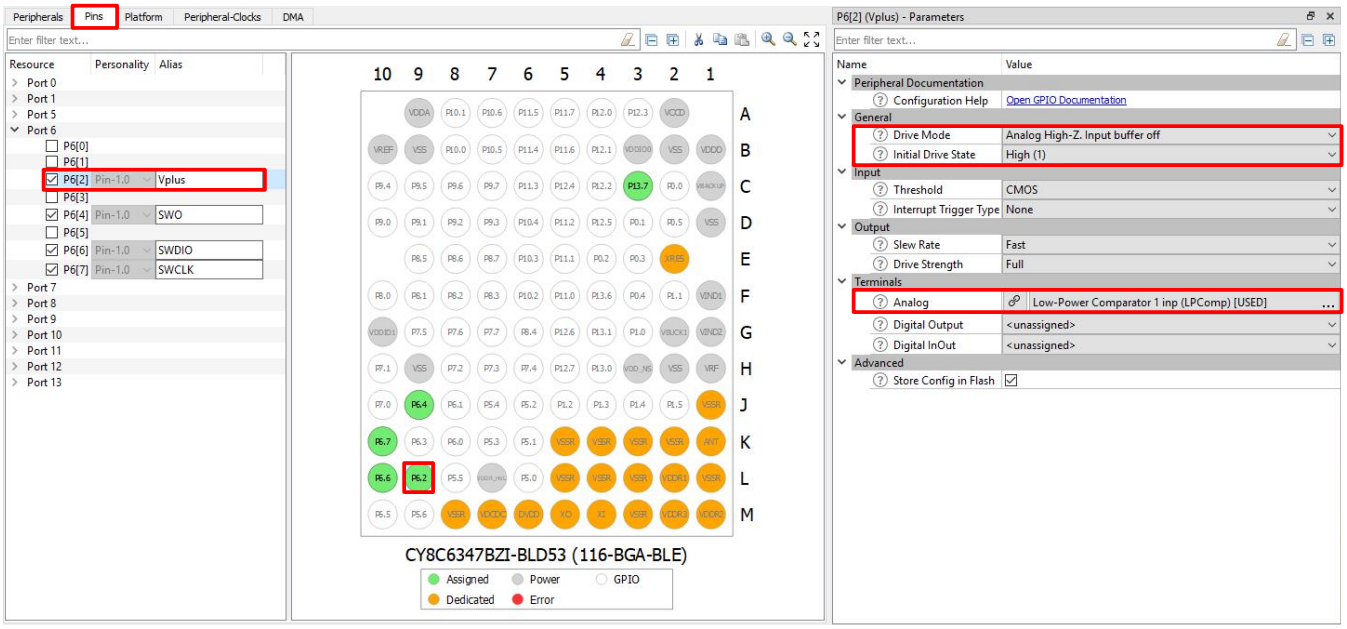

Figure 3. GPIO Configuration for LED Pin

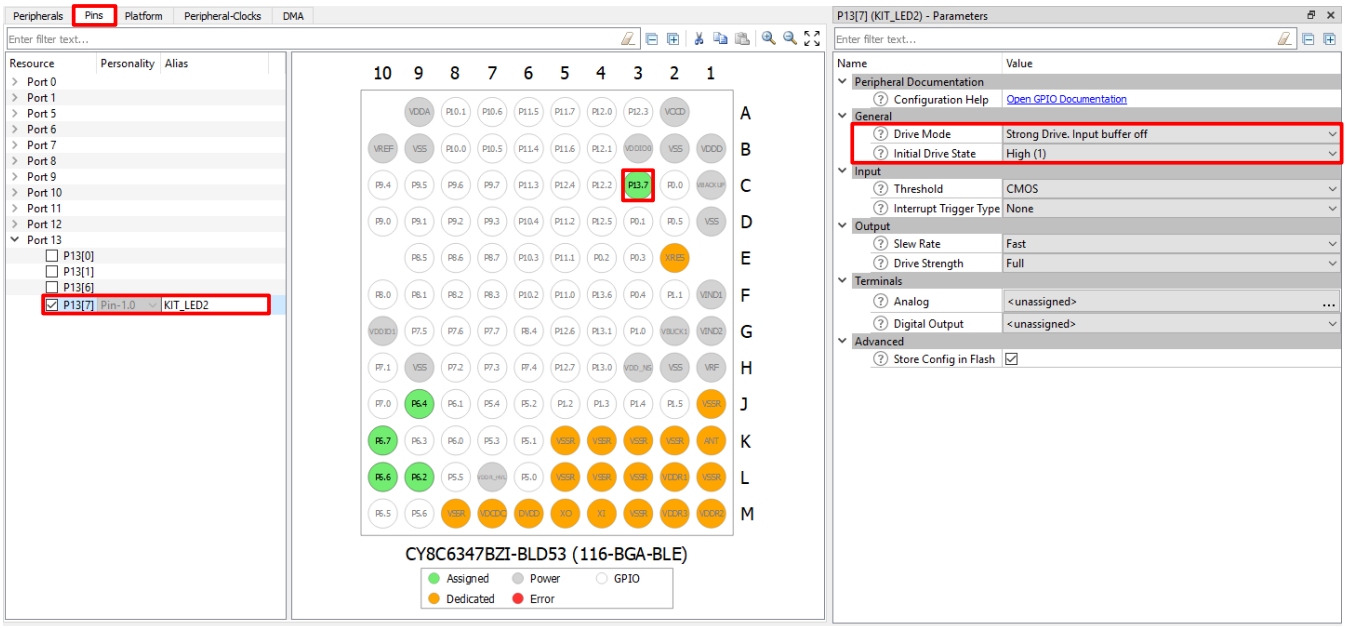

Reusing this Example

This example is designed for the supported kits. To port the design to a different PSoC 6 MCU device, right-click an application project and choose **Change Device**. If changing to a different kit, you may need to reassign pins.

Table 2. Device and Pin Mapping Table across PSoC 6 MCU Kits

Kit Name	Device Used	LED
CY8CKIT-062-WiFi-BT	CY8C6247BZI-D54	P13[7]
CY8CKIT-062-BLE	CY8C6347BZI-BLD53	P13[7]
CY8CPROTO-062-4343W	CY8C624ABZI-D44	P13[7]

In some cases, a resource used by a code example (for example, an IP block) is not supported on another device. In that case the example will not work. If you build the code targeted at such a device, you will get errors. See the device datasheet for information on what a particular device supports.
