

Objective

This code example demonstrates generating a One-Time Password (OTP) using the True Random Number generation feature of PSoC® 6 MCU cryptography block.

Requirements

Tool: [ModusToolbox™ IDE 1.1](#)

Programming Language: C

Associated Parts: All [PSoC 6 MCU](#) parts

Related Hardware: [PSoC 6 BLE Pioneer Kit](#), [PSoC 6 WiFi-BT Pioneer Kit](#), [PSoC6 WiFi-Prototyping Kit](#)

Overview

This example demonstrates generating a One-Time-Password (OTP) of eight characters in length. Using the True Random Number generation feature of the PSoC 6 MCU crypto block, a random number corresponding to each character of the OTP is generated. The generated random number is such that it corresponds to alpha-numeric and special characters of the ASCII code. The generated OTP is then displayed on a UART terminal emulator.

Hardware Setup

This example uses the kit's default configuration. Refer to the kit guide to ensure that the kit is configured correctly.

Software Setup

This example uses Tera Term as the UART terminal for displaying the generated OTP. If you don't have one, install one. This example uses Tera Term.

Operation

1. Connect the kit to your PC using the provided USB cable.
2. Import the code example into a new workspace. See [KBA225201](#).
3. Program the PSoC 6 MCU device. In the project explorer, select the **mainapp** project. In the Quick Panel, scroll to the **Launches** section and click the **Program (KitProg3)** configuration. Program configurations also build the code.
4. Open Tera Term and connect to the USB-UART bridge COM port. Set the connection to 115200 bps, 8N1.
5. Press the **Enter** key to generate an OTP. The generated OTP will be displayed on the UART terminal. Note that you must press the **Enter** key every time when you need to generate an OTP.

[Figure 1](#) shows a sample output as displayed on the Tera Term UART Terminal.

Design and Implementation

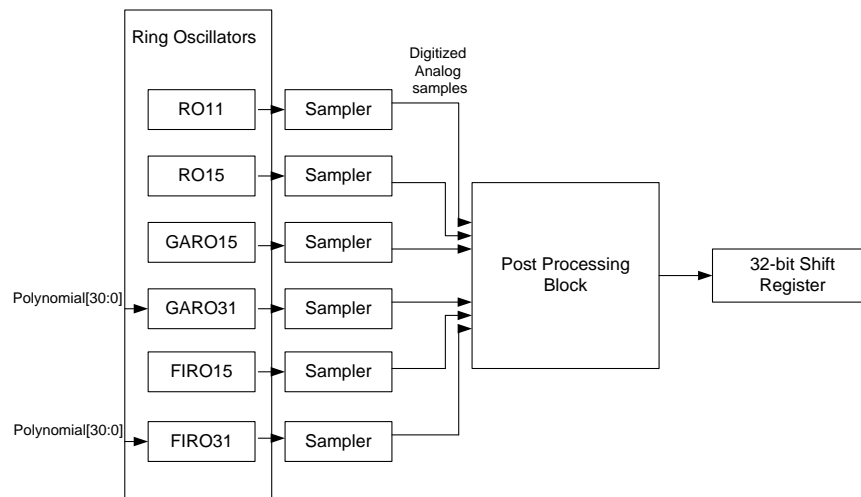

Random number generation is the generation of a sequence of numbers or symbols that cannot be predicted based on the previous knowledge of the generated sequence. Random number generators have applications in cryptography, statistical sampling, gambling, and other areas where producing an unpredictable result is desirable.

A true random number is generated using a hardware random number generator that generates random numbers from a physical process. The true random number generator (TRNG) in PSoC 6 MCU generates true random numbers of programmable bit size ranging from 0 to 32 bits. The TRNG relies on up to six ring oscillators to provide physical noise sources namely:

- Two fixed ring oscillators consisting of 11 and 15 inverters (RO11 and RO15).
- A fixed Galois-based ring oscillator (GARO15) and a fixed Fibonacci-based ring oscillator (FIRO15) each consisting of 15 inverters.
- A flexible Galois-based (GARO31) and a flexible Fibonacci-based oscillator (FIRO31) consisting of 31 inverters with a programmable polynomial of up to order 31.

A ring oscillator consists of a series of inverters connected in a feedback loop to form a ring. Due to (temperature) sensitivity of inverter delays, jitter is introduced on a ring's oscillating signal. The jittered oscillating signal is sampled to produce a digitized analog signal (DAS). This is done for all multiple ring oscillators. To increase entropy and to reduce the bias in DAS bits, the DAS bits are further post-processed. Post-processing produces bit samples that are considered true random bit samples. The true random bit samples are shifted into a register to provide random values of up to 32 bits. [Figure 2](#) shows an overview of how generation of true random generation is implemented in PSoC 6 MCU.

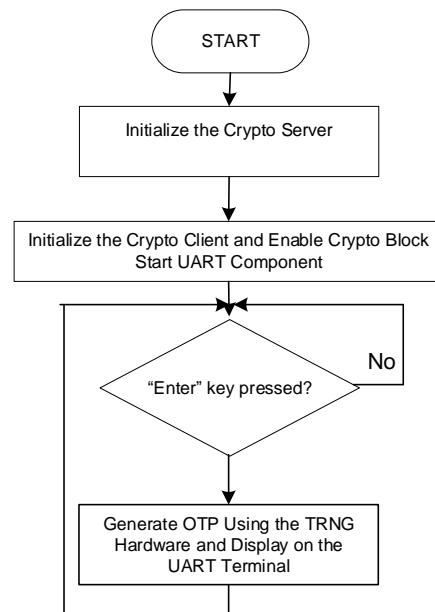

Figure 2. True Random Number Generation in PSoC 6 MCU

Cryptographic operation in this example is based on a Client-Server model. In this example, both the Crypto Server and the Crypto Client runs on the CM4 CPU. The firmware initializes and starts the Crypto Server. The firmware then provides the configuration data required for generation of true random numbers and requests the Crypto Server to run the cryptographic operation.

In this example, an OTP of eight characters in length is generated. Using the true random number generator, a random number is generated corresponding to each character of the OTP. The generated random number is such that it corresponds to alpha-numeric and special characters of the ASCII code. The generated OTP is then displayed on a UART terminal emulator. Each time, the firmware waits for the user to press the “Enter” key to generate a new OTP.

Resources and Settings

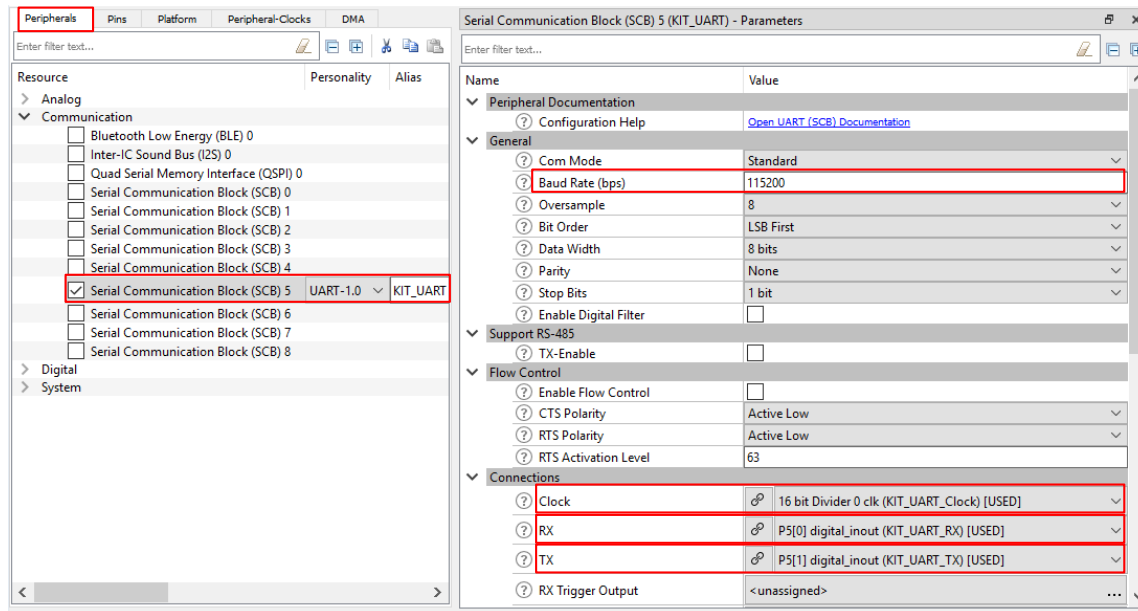

Table 1 lists the ModusToolbox resources used in this example, and how they are used in the design. For pin usage and configuration, open the **Pins** tab of the *design.modus* file.

Table 1. ModusToolbox Resources

Resource	Alias	Purpose
Serial Communication Block (SCB) – UART mode	KIT_UART	Send to and receive data from the UART Terminal.

Figure 4 highlights the non-default settings for the SCB (UART mode).

Figure 4. SCB (UART mode) Configuration

Reusing This Example

This example is designed for the supported kits. To port the design to a different PSoC 6 MCU device, right-click an application project and choose **Change Device**. If changing to a different kit, you may need to reassign pins.

Table 2. Device and Pin Mapping Table Across PSoC 6 MCU Kits

Kit Name	Device Used	KIT_UART_RX	KIT_UART_TX
CY8CKIT-062-BLE	CY8C6347BZI-BLD53	P5[0]	P5[1]
CY8CKIT-062-WiFi-BT	CY8C6247BZI-D54	P5[0]	P5[1]
CY8CPROTO-062-4343W	CY8C624ABZI-D44	P5[0]	P5[1]

In some cases, a resource used by a code example (for example, an IP block) is not supported on another device. In that case, the example will not work. If you build the code targeted at such a device, you will get errors. See the device datasheet for information on what a particular device supports.
