

Objective

This code example demonstrates generating a unique hash value or message digest for an arbitrary message using Secure Hash Algorithm (SHA) in PSoC® 6 MCU.

Requirements

Tool: [ModusToolbox™ IDE 1.1](#)

Programming Language: C

Associated Parts: All [PSoC 6 MCU](#) parts

Related Hardware: [PSoC 6 BLE Pioneer Kit](#), [PSoC 6 WiFi-BT Pioneer Kit](#), [PSoC 6 WiFi-Prototyping Kit](#)

Overview

This code example shows how to generate a 32-byte hash value or message digest for an arbitrary user input message with the SHA2 algorithm using the Cryptographic hardware block in PSoC 6 MCU. The example further shows that any change in the message results in a unique hash value for the message. The hash value generated for the message is displayed on a UART terminal emulator.

Hardware Setup

This example uses the kit's default configuration. Refer to the kit guide to ensure that the kit is configured correctly.

Software Setup

This example uses Tera Term as the UART terminal for displaying the generated message digest. If you don't have one, install one; this example uses Tera Term.

Operation

1. Connect the kit to your PC using the provided USB cable.
2. Import the code example into a new workspace. See [KBA225201](#).
3. Program the PSoC 6 MCU device. In the project explorer, select the **mainapp** project. In the Quick Panel, scroll to the **Launches** section and click the **Program (KitProg3)** configuration. Program configurations also build the code.
4. Open Tera Term and connect to the USB-UART bridge COM port. Set the connection to 115200 bps, 8N1.
5. Press the reset button on the kit and enter the message for which hash value or the message digest should be generated. The generated hash value is printed on the UART terminal. Note that for every input message, the SHA operation generates a unique hash value.

For example, the message "The quick brown fox jumps over the lazy dog", which uses every letter in the English alphabets, has a message digest value completely different from the message digest value for the message "The quick brown fox jumps over the lazy Dog" even though they have a very small variation ('D' instead of 'd').

[Figure 1](#) shows a sample output as displayed on the Tera Term UART Terminal.

Enter the message:
The quick brown fox jumps over the lazy Dog

Hash Value for the message:

0x73 0x25 0xE8 0x31 0x81 0x6C 0x7C 0xE2 0x6F 0xF5 0xD8 0x82 0xDA 0x79 0x18 0xEA
0x3B 0x24 0xCE 0xE1 0x51 0x42 0x8E 0x63 0x74 0x75 0x83 0xF2 0xBE 0xAD 0x53 0x8D

Enter the message:
```

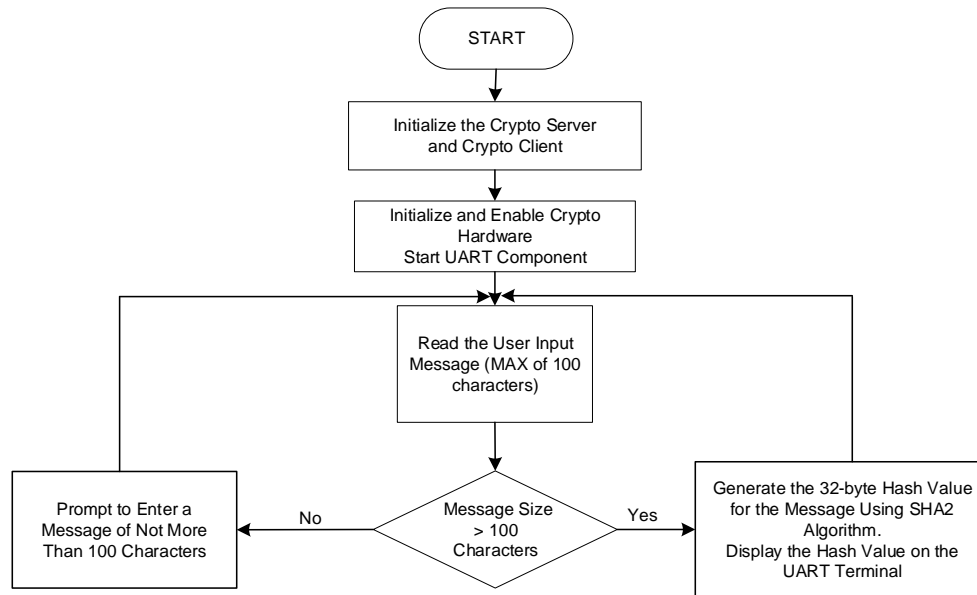

Design and Implementation

Secure Hash Algorithm is a function that takes a message of arbitrary length and reduces it to a fixed length residue or message digest after performing a series of mathematically defined operations that practically guarantee that any change in the message will change the hash value. A hash value is used for message authentication by transmitting a message with a hash value appended to it and recalculating the message hash value using the same algorithm at the recipient's end. If the hashes differ, it indicates that the message has been corrupted.

Cryptographic operation in this example is based on a Client-Server model. In this example, both the Crypto Server and the Crypto Client runs on the CM4 CPU. The firmware initializes and starts the Crypto Server and the Crypto Client. The firmware then provides the configuration data required for the SHA operation and requests the Crypto Server to run the cryptographic operation. Secure Hash Algorithm is directly implemented in hardware using the Crypto block of PSoC 6 MCU.

In this example, the user input message is read from the UART terminal and a 32-byte long hash value is generated using the SHA2 algorithm. For any arbitrary message, a 32-byte long hash value is generated. The 32-byte hash value for the user input message is then displayed on the UART terminal emulator. Note that in this example, the maximum message size is restricted to 100 characters. If you need to increase the message size change the macro `MAX_MESSAGE_SIZE` in the `main.c` to the message size that you require.

Resources and Settings

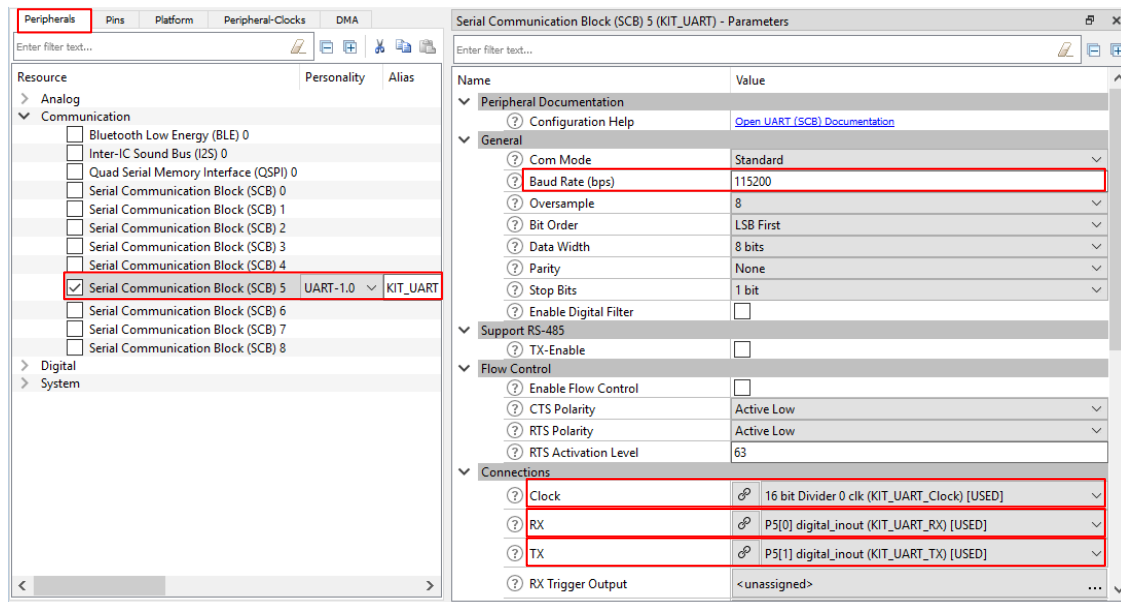

Table 1 lists the ModusToolbox resources used in this example, and how they are used in the design. For pin usage and configuration, open the **Pins** tab of the *design.modus* file.

Table 1. ModusToolbox Resources

Resource	Alias	Purpose
Serial Communication Block (SCB) – UART mode	KIT_UART	Send to and receive data from the UART Terminal.

Figure 3 highlights the non-default settings for the Serial Communication Block (SCB) in UART mode.

Figure 3. SCB (UART mode) Configuration

Reusing This Example

This example is designed for the supported kits. To port the design to a different PSoC 6 MCU device, right-click the application project and choose **Change Device**. If changing to a different kit, you may need to reassign pins.

Table 2. Device and Pin Mapping Table Across PSoC 6 MCU Kits

Kit Name	Device Used	KIT_UART_RX	KIT_UART_TX
CY8CKIT-062-BLE	CY8C6347BZI-BLD53	P5[0]	P5[1]
CY8CKIT-062-WiFi-BT	CY8C6247BZI-D54	P5[0]	P5[1]
CY8CPROTO-062-4343W	CY8C624ABZI-D44	P5[0]	P5[1]

In some cases, a resource used by a code example (for example, an IP block) is not supported on another device. In that case, the example will not work. If you build the code targeted at such a device, you will get errors. See the device datasheet for information on what a particular device supports.
